

## APPLICATIONS OF CALCULUS

- 1 The Point O is the intersection of two roads that cross at right angles as shown. One car travels towards O from the north at  $20\text{ms}^{-1}$  while the second travels due east towards O also at  $20\text{ms}^{-1}$ .

- (a) Show that after  $t$  seconds their distance apart,  $d$ , is given by

$$d = \sqrt{(100 - 20t)^2 + (80 - 20t)^2}$$

- (b) Show that this simplifies to

$$d^2 = 400[(5 - t)^2 + (4 - t)^2]$$

(c) Show, using calculus that the minimum distance between the two cars is  $10\sqrt{2} m$ .

(d) Now show, without using calculus, that the minimum distance between the two cars is  $10\sqrt{2} m$

- 2 Two straight roads cross at right angles at  $O$ . John is running along one of the roads towards  $O$  at  $7 \text{ m s}^{-1}$ . Mary is cycling along the other road at  $24 \text{ m s}^{-1}$ . When John is  $100 \text{ m}$  from  $O$ , Mary is at  $O$ .

(i) Find an expression for the distance between John and Mary.

(ii) Hence find the shortest distance between John and Mary at any time  $t$ .

1987 QUESTION 2b: AN ALTERNATIVE TO USING  $V_A = V_B$

A car starts from a point  $O$  with an initial speed of  $8 \text{ ms}^{-1}$  and then travels with a uniform acceleration of  $4 \text{ ms}^{-2}$ . Two seconds later a second car  $Q$  starts with an initial velocity of  $30 \text{ ms}^{-1}$  and then moves with a uniform acceleration of  $3 \text{ ms}^{-2}$ .

*Show that after passing  $P$ ,  $Q$  will never be ahead by more than  $74\text{m}$ .*

- (i) Find an expression for the distance travelled by car  $P$  at time  $t$  seconds
  
  
  
  
  
  
  
  
  
  
- (ii) Find an expression for the distance travelled by car  $Q$  at time  $t$  seconds
  
  
  
  
  
  
  
  
  
  
- (iii) Find an expression for the distance between the two cars
  
  
  
  
  
  
  
  
  
  
- (iv) Find the time when distance between them is minimum
  
  
  
  
  
  
  
  
  
  
- (v) Find minimum distance between them

1992 QUESTION 1b

Two particles  $P$  and  $Q$  are moving in the same direction along parallel straight lines. Their accelerations are  $5 \text{ m/s}^2$  and  $4 \text{ m/s}^2$ , respectively. At a certain instant  $P$  has a velocity  $1 \text{ m/s}$  and  $Q$  is  $25.5 \text{ m}$  behind  $P$  moving with velocity  $11 \text{ m/s}$ .

- (i) Prove that  $Q$  will overtake  $P$  and that  $P$  will in turn overtake  $Q$ .  
**(ii) When  $Q$  is in front of  $P$  find the greatest distance between the particles.**

Find expression for distance travelled by  $P$

Find expression for distance travelled by  $Q$

Find an expression for the distance,  $D$ , between the particles when  $Q$  is in front of  $P$

Find the maximum distance between them

1997 QUESTION 3b

A particle is projected from a point  $p$  with initial speed  $15\text{m/s}$ , down a plane inclined at an angle of  $30^\circ$  to the horizontal. The direction of projection is at right angles to the inclined plane.

(The plane of projection is vertical and contains the line of greatest slope).

Find

- (i) the perpendicular height of the particle above the plane after  $t$  seconds and hence, or otherwise, show that the vertical height  $h$  of the particle above the plane after  $t$  seconds is  $10\sqrt{3}t - 4.9t^2$
- (ii) **the greatest vertical height it attains above the plane (i.e. the maximum value of  $h$ ) correct to two places of decimals.**
